FITTING DISTRIBUTOR SUPPRESSORS — SPECIAL CASE

DISTRIBUTOR CAP No. 400181

The moulded distributor cap No. 400181 is a six-cylinder cap with vertical outlets and was originally supplied with model DK6A distributors. As part of this distributor it was fitted to a large number of pre-war cars, and it has also been used as a service replacement.

The brass contact inserts of this cap are recessed on their upper surfaces. As a result the spring-loaded plunger of the standard suppression resistor (No. 78114A) will not make contact with the insert unless a brass or copper washer is dropped into the terminal housing before screwing the resistor in position. The split washer used for connecting high tension cables to the distributor is suitable for this purpose.
